                                                                                                                                                                                                                                                                                                                                                                                                                                                                  05-JUN-1985
                                                                                                                                                                                                    The claimed peptide antagonists inhibit the release of gonadotrophins and/or steroids. They are antagonistic to GnRH, inhibit ovulation, and may cause resorption of a fertilised egg if administered shortly after absorption. The peptides also have utility in male contraception, and in treatment of precoscious puberty, hormone dependent neoplasia, dysmenorrhoea and endometriosis.
                                                                                                                                                                                                                                                                                                        New GnRH antagonist peptide(s) - useful as inhibitors of gonadotropin(s) and/or steroid(s) for contraceptive use.

The process is rapid and gives very pure peptide quickly and using little equipment. The peptide can be used in veterinary medicine to synchronise ovulation in large animal herds, and in human medicine in the treatment of fertility disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; page 7; 8pp; german.

                                                                                                                                                                                                                                                                                                                                                                                                                                                Analogues (I) of the sequence pref. have amino acid (AA) substitutions at posns. 2 (his is replaced by a D-AA) and 6 (gly is replaced by a D-AA). A therapeutically effective amt. of such an antagonist is contained in a pharmaceutical compson. alongside a menopausal-symtom-alleviating amt. of a 19-nor progestational agent (II) (pref. both in single formulation). A pref. administered nasally in dosages of 0.01-1 mg/kg/ day for (II) and 0.02-0.07 mg/kg/day for (II). May be used for inhibition of ovulation, and treatment of eg endometriosis, breast cancer, polycistic ovarrian disease, or precocious puberty in female mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-FEB-1989

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The C-terminal residue (Gly-CO-NH2) can be replaced by ethylamide. This peptide and fragments of it (i.e. amino acids 4-10, 5-10, 6-10 and 7-10) are agonists and antagonists of LHRH. They are useful for treating e.g. precoclous or delayed puberty, psychiatric disorders esp. those of the libido or sexual aggression, etc. In addition they are useful for functional exploration of the hypothalamus-hypophyseal are useful for functional exploration of the hypothalamus-hypophyseal axis and for radioimunological or biological assay (of LH, FSH and
       New deca:peptide luteinising hormone-releasing hormone antagonists - for treating precocious puberty, hormone dependent tumours, endometritis, cystic diseases; also as contraceptive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     puberty, hormone dependent tumours, e.g. malignant and benign prostate tumours, e.g. secondary amenorihoea, endometriosis and ovarian and mammary cystic diseases. The peptide is also useful for regulating ovulation e.g. as precoital or postcoital contraceptives, for synchronising oestrus in livestock and for improving the "rhythm" method. It is also useful for regulating the human menopausal gonadotropin, follicle stimulating and LH levels during premenopausal and postmenopausal periods. As it suppresses the spermatogenesis and testosterone levels in males, it may be of potential use for male contraception.
Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      which possesses high antiovulatory and antineoplastic activity, is free of anaphylactoid side effects and is believed to be free of endematogenic effects. The peptide may be used to treat precocious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 1; 43pp;

cc a heterogeneous population expressing diverse HLA phenotypes, and (8) cc an adjuvant peptide sequence from the invasin protein of versinia. cc spacer amino acid sequences (e.g. Gly-Gly) can be provided between the components in the hapten is LHRH, then optionally the invasin domain components. When the hapten is LHRH, then optionally the invasin domain components equence represents an LHRH hapten which can be the present sequence represents an LHRH hapten which can be cattached to the stimulator to provide a potent vaccine for attached to the stimulator to provide a potent vaccine for creating e.g. prostatic hyperplasia, androgen-dependent carcinoma, constructions tumours, recurrent functional ovarian cysts, (severe) conduction of infertility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to the resin via a photosensitive linker. The nonapeptide is cleaved from the resin by photolysis, the C-terminal is activated, and the product is coupled with glycinamide to add the Gly-NH2. The decapeptide is then deprotected. In the decapeptide, Xaa is Gly (giving gonadorelin; the present sequence), D-2-Nal or D-Trp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

This sequence represents naturally occuring gonadotropin releasing hormone (GnRH). Analogues of GnRH are represented by AAR86846-56.

Motility disorders, including functional bowel disease, can be treated by the administration of one of the GnRH analogues shown here (e.g. by the administration of one of the GnRH analogue inhibiting leuprolide acetate). This is due to the GnRH analogue inhibiting production of reproductive hormones such as luteinising hormone, progesterone and relaxin. Motility disorders are caused from progesterone and relaxin motility disorders are caused from abnormalities of the autonomic nervous system. Due to this, the GnRH abnormalities of the autonomic nervous system.
                                                                                                                                                                                                                                                                                        Treating motility disorders associated with systemic lupus erythematosus - by admin. of gonadotropin releasing hormon analogue, to control nausea, vomiting, abdominal pain etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18-JUL-1995

The GORH analogues are administered by injection (which may be intavenous, subcutaneous or intramuscular), or by a drug delivery system. The drug delivery system can comprise a drug implant with timed release, a nasal spray or an injection of a long-lasting depo form. This method is used to alleviate symptoms such as nausea, vomiting, abdominal pain and altered bowel habits. The sequences can be used to treat motility disorders in a wide variety of other diseases including irritable bowel syndrome, diabetes, scleroderma and Parkinson's disease.
                                                                                                                                           8 Different forms of GnRH (given in AAR75152-59) have previously been isolated from vertebrate species. A precursor for an additional form of GnRH, (Ser8)-GnRH (AAR75151), has now been

     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gonadoliberin precursor [validated] - human
NAlternate names: gonadotropin releasing hormone (GnRH); luteinizing hormone releasi
NAlternates names: gonadotropin releasing hormone (GAP); progonadoliberin
NContains: gonadoliberin-associated protein (GAP); progonadoliberin
C;Species: Homo sapiens (man)
